

『Be on alert for flood disasters!!』

If torrential rain continues for hours, or the rainfall amounts to over 100mm, thorough attention to possible sediment disasters, debris flood, cliff and land slides is required.

Rivers may become flooded with water from mountains in the vicinity, suddenly making the river a sweeping torrent. The rain can also trigger flash flooding and the cliff may collapse all of sudden.

Middle and small class rivers may flood suddenly due to floating debris being stuck at a bridge. Please pay good attention not to approach these rivers especially when a torrential rain hits your area.

Water disasters at rivers, such as being left at a sandbar in the middle of a flooded river, or being caught in a flash flood, take place very often in summer.

When you go on a hike or play at a river, do not forget to check weather forecasts. Escape well in advance from any danger.

When you go out for recreational activities, you should be always careful about changes in the weather.
